1. Let $A \in C^{m\times m}$ be both upper-triangular and unitary. Show that A is a diagonal matrix. Does the same hold if $A \in C^{m\times m}$ is both lower-triangular and unitary?

   Proof. **(Upper Triangular, by Induction)**

   Assume matrix $A \in \mathbb{C}^{m\times m}$ is unitary and is upper triangular such that,

$$A^*A = \mathrm{I}_m = AA^*$$

$$A = \begin{bmatrix} a_{11} & a_{12} & \cdots & a_{1m} \\ 0 & a_{22} & \cdots & a_{2m} \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & a_{mm} \end{bmatrix}$$

   Where A^* is the complex transpose matrix of A. We have then that A^* is of the form,

$$A^* = \begin{bmatrix} \overline{a_{11}} & 0 & \cdots & 0 \\ \overline{a_{12}} & \overline{a_{22}} & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ \overline{a_{1m}} & \overline{a_{2m}} & \cdots & \overline{a_{mm}} \end{bmatrix}$$

   Then the product of matrix multiplication of A^* and A is then defined as B, (i.e. $B = A^*A$), and because A is a Unitary matrix, is equal to I.

   (Base Case):

   Now assume that the elements above the diagonal in A are non-zerp. Next examine the $(1,1)$ and $(2,1)$ cells of the matrix product, B. By the operation of Matrix multiplication we should have,

$$B(2,1) = a_{11}\cdot\overline{a_{12}} = \mathrm{I}_m(2,1) = 0$$

$$B(1,1) = a_{11}\cdot\overline{a_{11}} = \mathrm{I}_m(1,1) = 1$$

   From this, we know that $a_{11} \neq 0$ and $\overline{a_{11}} \neq 0$. But we have that the product of $a_{11}\cdot\overline{a_{12}} = 0$. Since we have that $a_{11} \neq 0$, we must therefore have that $\overline{a_{12}} = 0$ and by the definition of a complex conjugate, $a_{12} = 0$.

   (Inductive Step)

   We need to show that for a integer $k \leq m-1$ all of the columns of matrix A, $\vec{C}_i$, up to $\vec{C}_k$ is of the form,

$$\vec{C}_i = \begin{bmatrix} 0 \\ \vdots \\ a_{ii} \\ \vdots \\ 0 \end{bmatrix}$$

then $\vec{C}_{k+1}$ is also of the same form. We have that in the matrix product between A^* and A, B, then the i-th row of B is defined as the inner produt between the i-th row of A^*, $\vec{r}_i^*$ and the j-th column of A, $\vec{c}_j$.

$$B(i,:) = [(\vec{r}_i^*, \vec{c}_1), (\vec{r}_2^*, \vec{c}_2), \cdots, (\vec{r}_i^*, \vec{c}_j)] = \mathrm{I}_m(i,:) = [0, \cdots, 1, \cdots, 0]$$

Look at the $(k+1)$-th row of B. We have from the given form of the columns, $\{\vec{c}_1, \cdots, \vec{c}_k\}$,

$$(\vec{r}_{k+1}^*, \vec{c}_j) = \overline{a_{j(k+1)}} \cdot a_{jj} = \left\{ \begin{array}{lll} 0 & \text{if,} & i \neq j \\ 1 & \text{if,} & i = j \end{array} \right\}, i, j < k+1$$

We also have that each $a_{ii} \neq 0$. Thereby, for all $j < k+1$,

$$\overline{a_{j(k+1)}} = 0 \implies a_{j(k+1)} = 0$$

We now write the column, $\vec{c}_{k+1}$.

$$\vec{c}_{k+1} = \begin{bmatrix} 0 \\ \vdots \\ a_{(k+1)(k+1)} \\ \vdots \\ 0 \end{bmatrix}$$

Therefore, we have that $\vec{c}_{k+1}$ is of the same form as $\vec{c}_i, i \leq k$. By induction, each column of A is of this form. Therefore, A is a diagonal matrix!

$\square$

Proof. **(Lower Triangular, by case of Upper Triangular)**
Assume as before, $A \in \mathbb{C}^{m \times m}$ is unitary and is lower triangular such that,

$$A^* A = \mathrm{I}_m = AA^*$$

$$A = \begin{bmatrix} a_{11} & 0 & \cdots & 0 \\ a_{21} & a_{22} & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ a_{m1} & a_{m2} & \cdots & a_{mm} \end{bmatrix}$$

Where A^* is the complex transpose matrix of A. We have then that A^* is of the form,

$$A^* = \begin{bmatrix} \overline{a_{11}} & \overline{a_{21}} & \cdots & \overline{a_{m1}} \\ 0 & \overline{a_{22}} & \cdots & \overline{a_{m2}} \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & \overline{a_{mm}} \end{bmatrix}$$

We then define the matrix $C = A^*$, $C^* = A$. Notice that C is an upper triangular, unitary matrix. By the previous proof, C is a diagonal matrix. Notice all of its "off-diagonal" elements are zero. As a consequnce, all (i, j)-elements of C which are zero imply that (j, i)-elements of C^* are zero. Therefore, $C^* = A$ is a diagonal matrix.

$\square$

2. Prove the following in each problem.

   (a) Let $A \in \mathbb{C}^{m \times m}$ be invertible and $\lambda \neq 0$ is an eigenvalue of A. Showthat λ^{-1} is an eigenvalue of A^{-1}.

Proof. Take any $A \in \mathbb{C}^{m\times m}$ to be invertible. Then we have inverse, A^{-1} exists such that,

$$AA^{-1} = \mathrm{I}_m = A^{-1}A$$

We also have by the fact that $\lambda \neq 0$ is an eigenvalue of A that,

$$\det(A - \lambda \mathrm{I}_m) = 0$$

We can substitute for I_m.

$$\det(A - \lambda \mathrm{I}_m) = \det(A - \lambda(A^{-1}A)) = \det(A)\det(\mathrm{I}_m - \lambda A^{-1}) = 0$$

$$\det(I_m - \lambda A^{-1}) = -\det(A^{-1} - \frac{1}{\lambda}\mathrm{I}_m) = 0$$

$$\det(A^{-1} - \frac{1}{\lambda}\mathrm{I}_m) = 0$$

Therefore, λ^{-1} is an eigenvalue of A^{-1}.

□

(b) Let $A, B \in \mathbb{C}^{m\times m}$. Show that AB and BA have the same eigenvalues.

(c) Let $A \in \mathbb{R}^{m\times m}$. Show that A and A^* have the same eigenvalues. (Hint 1: Use $\det(M) = \det(M^T)$ for any square matrix $M \in \mathbb{R}^{m\times m}$ in connection to the definition of characteristic polynomials. Hint 2: When a real-valued matrix A has a complex eigenvalue λ, then $\overline{\lambda}$ is also an eigenvalue of A.)
